## Key words:

Difference sets, Difference sets in algebra, Maximal difference set, Homomorphism of algebra, Banach algebra.

#### Abstract

In this paper we introduce difference sets in algebra. We study their properties and prove some interesting results. We define a maximal difference set and show that a proper left difference set of an algebra with identity can be embedded in a maximal difference set. Then we prove difference set under homomorphism of one algebra to another. We also develop a difference set in context of a Banach algebra.

## I. Introduction

A ring is an additive abelian group R which is closed under a second operation called multiplication-the product of two elements x and y in R is written $\mathrm{x} \mathrm{y}-$ in such a manner that
(i) multiplication is associative, that is if $x, y, z$ are three elements in R, then $x(y z)=(x y) z$;
(ii) multiplication is distributive, i.e. if $x, y, z$ are three elements in $R$, then

$$
\begin{aligned}
& x(y+z)=x y+x z \\
& \quad \text { and }(x+y) z=x z+y z .
\end{aligned}
$$

$R$ is called a commutative ring if $\mathrm{x} y=\mathrm{y} x$ for all elements x and $y$ in $R$. If the ring $R$ contains a non-zero element 1 with the Since an algebra is also a ring, it may be commutative or noncommutative and may or may not have identity; and if it does have identity, then we can speak of its regular and singular elements. An algebra is real or complex according as the field

[^0]property that $\mathrm{x} .1=1 . \mathrm{x}=\mathrm{x}$ for any x , then 1 is called the identity elements and R is called a ring with identity. Let R be ring with identity. If $x$ is an element in $R$, then it may happen that there is present in $R$ an element y such that $\mathrm{x} y=\mathrm{yx}=1$. In this case there is only one such element, and it is written as $x^{-1}$ and called the inverse of $x$. If an element $x$ in $R$ has an inverse then $x$ is said to be regular. Elements which are not regular are called singular. Regular elements are often invertible elements, or non-singular elements. ${ }^{1}$

A linear space $A$ is called an algebra if its vectors can be multiplied in such a way that A is also a ring in which scalar multiplication is related to multiplication by the following property:-

$$
\alpha(x y)=(\alpha x) y=x(\alpha y)
$$

where $x, y \in A$ and $\alpha$ is a scalar.
of scalars is the set of real or complex number respectively. A subalgebra of an algebra $A$ is non-empty subset $A_{0}$ of $A$ which is an algebra in its own right with respect to the operations in A. An ideal in an algebra A is defined to be a subset I with the following three properties:-
(i) I is a linear subspace of A ;
(ii) $\mathrm{i} \in \mathrm{I} \Rightarrow \mathrm{x} i \in \mathrm{I}$ for every element $\mathrm{x} \in \mathrm{A}$;
(iii) $\mathrm{i} \in \mathrm{I} \Rightarrow \mathrm{ix} \in \mathrm{I}$ for every elements $\mathrm{x} \in \mathrm{A} .^{2}$

We define a maximal left ideal in A to be a proper left ideal which is not properly contained in any other proper left ideal. We define the radical R of A to be the intersection of all its maximal left ideal. i.e. $\mathrm{R}=\cap \mathrm{MLI}{ }^{3}$

In analogy with these ideals we define a difference set in a real or complex algebra $A$ to be subset $G$ with the following three properties:-
(i) G is a difference set of A , regarding A as a linear space.
(ii) $\mathrm{g} \in \mathrm{G} \Rightarrow \mathrm{x} g \in \mathrm{G}$, for every element $\mathrm{x} \in \mathrm{A}$.
(iii) $g \in G \Rightarrow g x \in G$, for every element $x \in A$.

P be a partially ordered set with " $\leq "$ as partial ordering. An elements $x$ in $P$ is said to be maximal if $y \geq x \Rightarrow y=x$, i.e. if no element other than $x$ itself is greater than or equal to $x$. Let A be a non-empty subset of a partially ordered set $P$. An element y in P is said to be an upper bound of A if a $\leq \mathrm{y}$ for every a $\in A$. According to Zorn's lemma if $P$ is a partially ordered set in which every chain has an upper bound then $P$ possesses a maximal element. ${ }^{4} \mathrm{~A}$ and $\mathrm{A}^{\prime}$ be algebras which are both real or both complex. We define a homomorphism of A into $\mathrm{A}^{\prime}$ to be a mapping f of A into $\mathrm{A}^{\prime}$ which preserves all the operations in the sense that

$$
\begin{gathered}
\mathrm{f}(\mathrm{x}+\mathrm{y})=\mathrm{f}(\mathrm{x})+\mathrm{f}(\mathrm{y}), \\
\mathrm{f}(\alpha \mathrm{x})=\alpha \mathrm{f}(\mathrm{x}), \alpha \text { being any scalar, } \\
\text { and } \mathrm{f}(\mathrm{x} y)=\mathrm{f}(\mathrm{x}) \mathrm{f}(\mathrm{y}) .
\end{gathered}
$$

An isomorphism is one-one homomorphism and A is said to be isomorphic to $\mathrm{A}^{\prime}$ if there exists an isomorphism of A onto $\mathrm{A}^{\prime} .{ }^{5}$

A Banach algebra is a complex Banach space which is also an algebra with identity 1 and in which the multiplicative structure is related to the norm by the following requirements:-
(i) $\|\mathrm{x} y\| \leq\|\mathrm{x}\| \cdot\|\mathrm{y}\|$,
(ii) $\|1\|=1$.

It follows that $\mathrm{x}_{\mathrm{n}} \rightarrow \mathrm{x}, \mathrm{y}_{\mathrm{n}} \rightarrow \mathrm{y} \Rightarrow \mathrm{X}_{\mathrm{n}} \mathrm{y}_{\mathrm{n}} \rightarrow \mathrm{xy} .{ }^{1}$
Suppose T is a topology on a vector space X such that
a) every point of $X$ is a closed set, and
b) the vector space operations are continuous with respect to T , then T is said to be a vector topology on X , and X is called a topological vector space.

The closure $\overline{\mathrm{E}}$ of $\mathrm{E} \subseteq \mathrm{X}$ is the intersection of all closed sets that contain E. ${ }^{6}$

## II. Theorems

Theorem1: Let A be an algebra. Let $G_{1}, G_{2}, \ldots \ldots \ldots ., G_{n}$ be difference sets of A and $\alpha_{1}, \alpha_{2}, \ldots \ldots ., \alpha_{\mathrm{n}}$ be scalars then $\sum_{i=1}^{n} \alpha_{i} G_{i} \quad$ is a difference set of A .

Proof : $\sum_{i=1}^{n} \alpha_{i} G_{i}$ is a difference set regarding A as a linear space.

Let $\mathrm{z} \in \alpha_{1} \mathrm{G}_{1}+\alpha_{2} \mathrm{G}_{2}+\ldots \ldots+\alpha_{\mathrm{n}} \mathrm{G}_{\mathrm{n}}$
We can write

$$
\mathrm{z}=\alpha_{1} \mathrm{~g}_{1}+\alpha_{2} \mathrm{~g}_{2}+\ldots \ldots .+\alpha_{\mathrm{n}} \mathrm{~g}_{\mathrm{n}}
$$

where $g_{i} \in G_{i}, i=1,2, \ldots \ldots, n$.
let $x \in A$, then

$$
\begin{aligned}
\mathrm{x} \mathrm{z} & =\mathrm{x}\left(\alpha_{1} \mathrm{~g}_{1}+\alpha_{2} \mathrm{~g}_{2}+\ldots \ldots .+\alpha_{\mathrm{n}} \mathrm{~g}_{\mathrm{n}}\right) \\
& =\alpha_{1} \times \mathrm{g}_{1}+\alpha_{2} \times \mathrm{g}_{2}+\ldots \ldots .+\alpha_{\mathrm{n}} \times \mathrm{g}_{\mathrm{n}} \\
& \in \alpha_{1} \mathrm{G}_{1}+\alpha_{2} \mathrm{G}_{2}+\ldots \ldots .+\alpha_{\mathrm{n}} \mathrm{G}_{\mathrm{n}}\left(\text { Since } \mathrm{G}_{\mathrm{i}}\right. \text { is }
\end{aligned}
$$

a difference set of algebra A therefore $\mathrm{xg}_{\mathrm{i}} \in \mathrm{G}_{\mathrm{i}}$ )
and

$$
\begin{aligned}
& \mathrm{z} \mathrm{x}=\left(\alpha_{1} \mathrm{~g}_{1}+\alpha_{2} \mathrm{~g}_{2}+\ldots \ldots+\alpha_{\mathrm{n}} \mathrm{~g}_{\mathrm{n}}\right) \mathrm{x} \\
&=\alpha_{1} \mathrm{~g}_{1} \mathrm{x}+\alpha_{2} \mathrm{~g}_{2} \mathrm{x}_{+} \ldots \ldots+\alpha_{\mathrm{n}} \mathrm{~g}_{\mathrm{n}} \mathrm{x} \\
& \in \alpha_{1} \mathrm{G}_{1}+\alpha_{2} \mathrm{G}_{2+}+\ldots \ldots+\alpha_{\mathrm{n}} \mathrm{G}_{\mathrm{n}} . \text { Hence } \alpha_{1} \mathrm{G}_{1} \\
&+\alpha_{2} \mathrm{G}_{2}+\ldots \ldots .+\alpha_{\mathrm{n}} \mathrm{G}_{\mathrm{n}} \text { is a difference set of A. }
\end{aligned}
$$

Theorem 2 : Let $G$ be a left difference set of an algebra A with identity 1 . If $1 \in G$ then $G=A$.
Proof: Since G is a left difference set of A, then

$$
\begin{equation*}
\mathrm{G} \subseteq \mathrm{~A} \tag{1}
\end{equation*}
$$

Let $x \in A$ then since $1 \in G, x .1 \in G$, or $x \in G$.

$$
\text { Thus } \mathrm{x} \in \mathrm{~A} \Rightarrow \mathrm{x} \in \mathrm{G}
$$

$$
\begin{equation*}
\text { Hence } \quad A \subseteq G(2) \tag{2}
\end{equation*}
$$

from (1) and (2) it follows that $\mathrm{G}=\mathrm{A}$.
Similarly if $G$ is a right difference set of an algebra A with identity 1 such that $1 \in G$ then $G=A$.
Finally, if G is a difference set of an algebra A with identity 1 such that $1 \in G$ then $G=A$.

Theorem3: Let $G$ be a proper left difference set of an algebra A with identity 1 . G can be embedded in a maximal left difference set of A .

Proof: Let P be a partially ordered set of all proper left difference sets of A containing G, partially ordered by set inclusion.
Let $\left\{G_{i}\right\}$ be a chain in P, i.e., it is a totally ordered family of proper difference sets of A each containing $G$.

Since $G \in\left\{G_{i}\right\}$ this family is non-empty.

Let $H=U_{i} G_{i}$, $H$ is a difference set of $A$ regarding $A$ as a linear space.

Let $g \in H$, then $g \in G_{i}$ for some $i$. since $G_{i}$ is a left difference set,

$$
\begin{aligned}
x \in \mathrm{~A} & \Rightarrow \mathrm{xg} \in \mathrm{G}_{\mathrm{i}} \\
& \Rightarrow \mathrm{xg} \in \mathrm{H} .
\end{aligned}
$$

Therefore H is a left difference set containing G . Since Gi is a proper left difference set then by theorem 2 ,

$$
1 \notin \mathrm{G}_{\mathrm{i}}
$$

Hence $1 \notin \mathrm{H}$. Thus H is a proper left difference set of A containing G.

Therefore $\mathrm{H} \in\left\{\mathrm{G}_{\mathrm{i}}\right\}$.
Also for any $\mathrm{i}, \mathrm{G}_{\mathrm{i}} \subseteq \mathrm{H}$.
Thus $H$ is an upper bound of $\left\{G_{i}\right\}$.
Since $\left\{G_{i}\right\}$ is any chain in $P$, we see that every chain in $P$ has an upper bound. Hence by Zorn's lemma, if G is not itself a maximal left difference set then there exists a maximal left difference set $\mathrm{G}^{\prime}$ of A such that $\mathrm{G} \subseteq \mathrm{G}^{\prime} \subseteq \mathrm{A}$.

Thus $G$ can be embedded in a maximal left difference set of $A$.
Thus any proper left difference set in A can be embedded in a maximal left difference set of A. Since $\{0\}$ is a proper left difference set, maximal left difference sets certainly exist.

Theorem4: Let A be an algebra with identity 1 . Let $G$ be a left difference set of A such that $G$ contains a left regular elements then $\mathrm{A}=\mathrm{G}$.

Proof: Let G contain a left regular element x then there exists another element y such that $\mathrm{y} \mathrm{x}=1$.

Since $\mathrm{x} \in \mathrm{G}, \mathrm{y} \mathrm{x} \in \mathrm{G}$.
Hence $1 \in G$.
Therefore by theorem2, $\mathrm{G}=\mathrm{A}$.
Similarly, if G is a right difference set containing a right element the $\mathrm{G}=\mathrm{A}$.

Finally, if $G$ is a difference set containing a regular element then $\mathrm{G}=\mathrm{A}$.

Thus any proper difference set of A cannot contain a regular element.

Theorem5: Let A , A' be algebras with the same field of scalars. Let f be a homomorphism of A onto $\mathrm{A}^{\prime}$, then the image of each difference set in A is a difference set in $\mathrm{A}^{\prime}$ and the inverse image of a difference set in $A^{\prime}$ is a difference set in $A$.
Proof: Let $G$ be a difference set of A. Since $f$ is also a linear transformation of linear space A onto $A^{\prime}$, then $f(G)$ is a difference set of linear space A'.

Let $\mathrm{z} \in \mathrm{f}(\mathrm{G})$ then $\mathrm{z}=\mathrm{f}(\mathrm{g})$ for $\mathrm{g} \in \mathrm{G}$.

Let $x \in A^{\prime}$. Since $f$ is onto, there exists $a \in A$ such that $x$ $=f(a)$.

Therefore $\mathrm{xz}=\mathrm{xf}(\mathrm{g})=\mathrm{f}(\mathrm{a}) \mathrm{f}(\mathrm{g})=\mathrm{f}(\mathrm{ag}) \in \mathrm{f}(\mathrm{G})$, for a g $\in \mathrm{G}$.

Also $\mathrm{zx}=\mathrm{f}(\mathrm{g}) \mathrm{f}(\mathrm{a})=\mathrm{f}(\mathrm{ga}) \in \mathrm{f}(\mathrm{G})$, for $\mathrm{ga} \in \mathrm{G}$.
Hence $f(G)$ is a difference set of $A^{\prime}$.
Let H be a difference set of $\mathrm{A}^{\prime}$. Then by theorem2, $\mathrm{f}^{-1}(\mathrm{H})$ is a difference set of linear space $A$.

Let $x \in f^{-1}(H)$, then $f(x) \in H$.
Let $a \in A$, then $f(a) \in A^{\prime}$.
Hence $f(a x)=f(a) f(x) \in H$

$$
\Rightarrow \mathrm{ax} \in \mathrm{f}^{-1}(\mathrm{H}) .
$$

Also $f(x a)=f(x) f(a) \in H$

$$
\Rightarrow \mathrm{xa} \in \mathrm{f}^{-1}(\mathrm{H}) .
$$

Hence $f^{-1}(H)$ is a difference set in $A$.
Theorem6: Let A be a Banach algebra and G a proper left difference set of A, then $\bar{G}$ is also a proper left difference set of A.

First we prove Lemma: If A is difference set of a topological vector space X then $\overline{\mathrm{A}}$ is also a difference set.
Proof: Let $\mathrm{x}, \mathrm{y} \in \overline{\mathrm{A}}$ then

$$
\begin{aligned}
& \quad \mathrm{x}-\mathrm{y} \in \overline{\mathrm{~A}}-\overline{\mathrm{A}} . \\
& \text { Now } \overline{\alpha A}+\overline{\beta A} \subseteq \overline{\alpha A+\beta A} .^{3}
\end{aligned}
$$

Putting $\alpha=1$ and $\beta=-1$, we have

$$
\overline{\mathrm{A}}-\overline{\mathrm{A}} \subseteq \overline{A-A}
$$

Hence $\mathrm{x}-\mathrm{y} \in \overline{\mathrm{A}}-\overline{\mathrm{A}} \subseteq \overline{A-A}$.
Since A is a difference set,

$$
\mathrm{A}-\mathrm{A} \subseteq \mathrm{~A} \Rightarrow \overline{A-A} \subseteq \overline{\mathrm{~A}}
$$

Therefore $\mathrm{x}-\mathrm{y} \in \overline{\mathrm{A}}$.
This shows that $\overline{\mathrm{A}}$ is a difference set.
Proof of the Theorem6: Since $G$ is a difference set of topological vector space A, then by above lemma, $\bar{G}$ is also a difference set of linear space A .

Let $\mathrm{g} \in \bar{G}$, then there exists a sequence $\left\{\mathrm{g}_{\mathrm{n}}\right\} \subseteq \mathrm{G}$ such that $\mathrm{g}_{\mathrm{n}}$ $\rightarrow \mathrm{g}$.
Let $\mathrm{x} \in \mathrm{A}$, then $\mathrm{x} \mathrm{g}_{\mathrm{n}} \rightarrow \mathrm{x} \mathrm{g}$. But $\left\{\mathrm{x} \mathrm{g}_{\mathrm{n}}\right\} \subseteq \mathrm{G}$ and hence $\mathrm{x} \mathrm{g} \in$ $\bar{G}$.

Therefore $\bar{G}$ is a left difference set of A .

Since G is a proper left difference set by theorem4, it cannot contain a regular element.

Let $S$ denote the set of singular elements of $A$,
then $\mathrm{G} \subseteq \mathrm{S}$.
Now $S$ is a closed set.
Thus $\mathrm{G} \subseteq \bar{G} \subseteq \mathrm{~S}$.
Since $1 \notin \mathrm{~S}, 1 \notin \bar{G}$.
Hence $\bar{G}$ is a proper left difference set of A . This completes the proof.

Similarly, if G is a proper right difference set of A, then $\bar{G}$ is also a proper right difference set of A.
Finally, if G is a proper difference set of A then $\bar{G}$ is a proper difference set of A .

## III. Concluding Remarks

Thus we have discussed difference sets, difference sets in algebra, homomorphism of difference set in algebra and difference set in a Banach algebra and proved interesting results.
